Pregnancy Scan Crate

S02800 - Pregnancy Scan Crate

Using ultrasound scanning technology to test for pregnancy in livestock not only tells you whether or not animals are pregnant, but also whether pregnant animals are carrying multiple foetuses (and if so, how many). Armed with this information you can make informed decisions such as:

- How best to allocate your valuable feed resources.
- Which animals require special care and treatment (e.g. because they are carrying multiple foetuses).
- Whether any animals should be culled (e.g. in a drought year you may decide to sell animals carrying multiple foetuses if feed is severely depleted and not likely to improve in the near future).
- Which animals will fetch the best prices
- (e.g. if you can prove an animal is pregnant you can get a higher price for it at the yards).

The ability to make informed decisions like this will give you:

- Improved survival rates for multiple births
- Improved returns from the sale of suplus livestock
- Improved milk production and weaning weights
